

Scalar and Vector Quantities

Sort the quantities as either scalar or vector. A scalar quantity only needs a number to represent it, and that is it (direction or orientation for this sort of quantity does not make sense; see below). A vector quantity needs both the number (to say how large) and direction (where it is pointing), so you need an arrow to represent it.

Quantities: Distance, Length, Displacement, Speed, Velocity, Acceleration, Force, Time, Mass, Weight, Energy, Volume, Density, Temperature, Gravity, Area, Pressure, Momentum, Impulse, Work, Power, Drag, Charge, Current, Resistance, Electric Field, Magnetic Field, Voltage, Potential Difference...
