Ray Tracing Template — the two-lens system

Draw the **parallel ray**, the **focal ray** and the **middle ray** with a straight edge. The object, both lenses and all four focal points are already placed at the positions Part III uses. Locate the image from lens 1, then treat it as the object of lens 2 and repeat. **The two axes are not to the same scale:** horizontal is the bench in centimetres, vertical is exaggerated ten times so the rays are drawable. Positions you read off the horizontal axis are correct; **do not measure image heights off this sheet.**
